

# Manjaro MacBookPro9,1

## Driver Wifi

Can you run the following commands one after the other.

```
sudo modprobe -r wl
sudo modprobe b43 allhwsupport=1
```

That should switch wifi on. To make it permanent open `/etc/modules-load.d/modules.conf` and add `b43` underneath:

```
# List of modules to load at boot
b43
```

- Now open `/etc/modprobe.d` folder
- Create empty document and name it `b43.conf`
- Open it and make it look like this: `options b43 allhwsupport=1`
- Reboot and it should work.

## Fix mini-DisplayPort

- Installer bumblebee `sudo pacman -S bumblebee mesa xf86-video-intel`
- Installé driver NVIDIA `sudo mhwd -a pci nonfree 0300`
